Diagrama de bloques:

Código de Arduino:

```
const int analogInPin0 = A0;
                               // Analog input pin that the potentiometer is attached
const int analogInPin1 = A1;
const int analogInPin2 = A2;
const int analogInPin3 = A3;
int sensorValue0 = 0;
                              // value read from the pot
int sensorValue1 = 0;
                              // value read from the pot
int sensorValue2 = 0;
                              // value read from the pot
int sensorValue3 = 0;
                              // value read from the pot
void setup() {
  // initialize serial communications at 9600 bps:
  Serial.begin(9600);
}
void loop() {
  // read the analog in value:
  sensorValue0 = analogRead(analogInPin0);
  sensorValue1 = analogRead(analogInPin1);
  sensorValue2 = analogRead(analogInPin2);
  sensorValue3 = analogRead(analogInPin3);
```

```
// print the results to the Serial Monitor:
    Serial.print(sensorValue0);
    Serial.print(",");
        Serial.print(sensorValue1);
    Serial.print(sensorValue2);
    Serial.print(",");
        Serial.print(number of the next loop for the analog-to-digital // converter to settle after the last reading: delay(50);
}
```
